Subject identification to the lab in any study is a problem. Laboratories are supposed to conduct tests without the knowledge of whose sample they are testing.

I am not arguing that the lab was biased—I don't know that.

However, since Floyd was known to have a therapeutic use exemption for the steroids used to treat his dead hip, and since this information was not redacted from his doping control form, sample identification was a relatively simple matter.

This part of the testing process should be improved to help the credibility of the process for all.
